

User Virtualization for Microsoft Desktops

Accelerate Windows 7 Deployments... Maximize App-V Adoption... De-risk virtual desktop adoption

AppSense and Microsoft

AppSense is the leading provider of user virtualization technology to enterprise. User virtualization manages all user-specific information independent of the Microsoft desktop, and applies this information into any desktop on-demand. Virtualizing all that is user-specific on the desktop enables IT to standardize the corporate build, automate desktop delivery, and migrate users to new desktops - all while ensuring the user experience is seamless, personal, predictable and easily manageable.

AppSense User Virtualization solutions span both physical and virtual Microsoft desktops, providing a comprehensive infrastructure to manage all aspects of the user independent of the method of desktop delivery.

Accelerate Windows 7 Deployments

AppSense ensures a seamless and accelerated migration to Windows 7 desktops by automatically capturing user settings from existing desktops, storing this data centrally, and reapplying it into both physical and virtual Windows 7 desktops. Moving users over to Windows 7 is quick and easy, and can be done across thousands of users simultaneously.

- > Seamlessly migrate personalization settings to Windows 7 desktops
- > Migrate users to physical or virtual Windows 7 desktops
- > Share user settings across XP, Vista and Windows 7 desktops

Maximize App-V Adoption

Unique to AppSense, user personalization settings can be applied to App-V delivered applications and shared with applications delivered by other means. So for example, a user with MS Office locally installed on their PC can share the personalization settings with MS Office delivered by App-V. Applications can now be delivered using App-V in combination with other mechanisms seamlessly to the user, maximizing the adoption of App-V technology.

- > Provide a consistent user experience across App-V apps
- > Share personal settings across App-V apps and other apps
- > Apply policy to dynamically configure App-V applications

Ensure successful Microsoft/Citrix VDI Implementations

AppSense technology is unique in its ability to enable organizations to adopt a mix of Microsoft and Citrix desktop delivery technologies (and in combination with other desktop and application delivery technologies), while ensuring all user specific information seamlessly follow the user to ensure a consistent experience. This includes local PCs, so companies can use virtual and physical desktops in combination across the environment with the same working experience.

- > Seamlessly migrate existing users to MS virtual desktops
- > Share user settings across physical PCs and virtual desktops
- > Scale out virtual desktop adoption to thousands of users

AppSense is a member of the Microsoft System Center Alliance and is recommended by Citrix for use with XenDesktop in mixed delivery technology environments.
